# INTERNATIONAL A-LEVEL PHYSICS

Unit 4 Energy and Energy resources

Time allowed: 2 hours

# **Materials**

For this paper you must have:

- a Data and Formulae Booklet as a loose insert
- a ruler with millimetre measurements
- a scientific calculator, which you are expected to use where appropriate
- a protractor.

### **Instructions**

- Use black ink or black ball-point pen.
- Fill in the boxes at the top of this page.
- Answer all questions.
- You must answer the questions in the spaces provided. Do not write outside the box around each page or on blank pages.
- All working must be shown.
- If you need extra space for your answer(s), use the lined pages at the end of this book. Write the question number against your answer(s).
- Do all rough work in this book. Cross through any work you do not want to be marked.

### Information

- The marks for questions are shown in brackets.
- The maximum mark for this paper is 80.

# Section A

Answer all questions in this section.

0 1

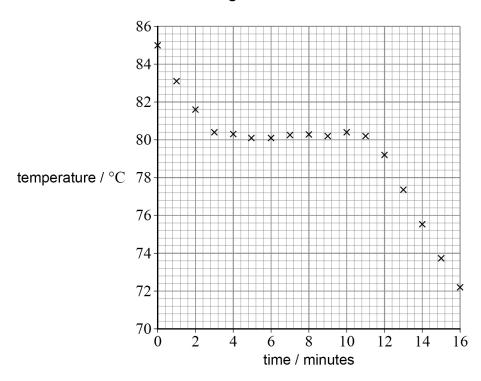

**Figure 1** shows a boiling tube containing melted wax at 85 °C. The boiling tube is in a beaker of cold water.

Figure 1

The temperature of the wax is recorded every minute for  $16\ \mathrm{minutes}$ . Figure 2 shows the results.

Figure 2

0 1.1	Estimate, using <b>Figure 2</b> , the melting point of the wax.	[1 mark]
	melting point =	°C
0 1 . 2	The internal energy of the wax decreases at an average rate of $7.8\ J\ s^{-1}$ c time the wax changes state.	during the
	Estimate the mass of wax in the boiling tube.	
	specific latent heat of the wax = $1.5 \times 10^5~J~kg^{-1}$	[3 marks]
	mass =	kg
0 1.3	Describe how the average kinetic energy and the average potential energy particles change between 8 and 16 minutes.	gy of the wax [2 marks]

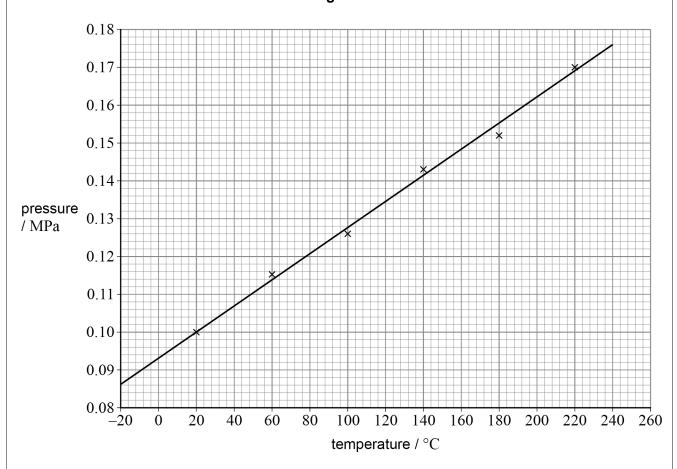

0 2 . 1	The volume of a fixed mass of gas is kept constant.
	Explain why the pressure of the gas decreases when the temperature is decreased.  [3 marks]
0 2 . 2	Show that the pressure $p$ of an ideal gas can be given as
	$p = rac{ ho RT}{M}$
	where $\rho$ is the density, $T$ is the absolute temperature and $M$ is the molar mass of the gas. [2 marks]
	[Z marks]

**0 2**. **3** Figure 3 shows the variation of pressure with temperature for a gas at a constant volume.

Figure 3

The density of the gas is  $1.6\ kg\ m^{-3}.$  Assume that the gas is ideal.

Determine, in  $kg\ mol^{-1},$  the molar mass of the gas.

[4 marks]

molar mass =

0 3	A flywheel energy storage system (FESS) stores kinetic energy in a rotating mass.
0 3.1	The flywheel in one FESS rotates at $1.4 \times 10^4$ revolutions per minute.
	Show that the angular speed of the flywheel is approximately $1.5 \times 10^3~rad~s^{-1}$ . [1 mark]
0 3.2	The flywheel has a moment of inertia of $92\ kg\ m^2$ .
	Show that the rotational kinetic energy stored by the flywheel is approximately $100\ \mathrm{MJ}.$
	[2 marks]
0 3 . 3	The flywheel connects to a generator. The generator exerts a constant resistive torque of $120\ \mathrm{N}\ \mathrm{m}$ on the flywheel for $4.0\ \mathrm{minutes}$ .
	Calculate the angular speed of the flywheel after 4.0 minutes. [3 marks]
	$angularspeed = \underbrace{}}_{rad}rads^{-1}$

0 3 . 4

The flywheel in one FESS is a solid steel cylinder, as shown in Figure 4.

# Figure 4

The maximum energy that can be safely stored in a FESS is limited by the material properties of the flywheel.

Designers consider replacing the steel flywheel with one of identical dimensions made of carbon fibre. Data about each material are shown in **Table 1**.

Table 1

Material	Breaking stress / GPa	Density / kg m <sup>-3</sup>
steel	1.5	$8.0 \times 10^{3}$
carbon fibre	4.5	$1.6 \times 10^{3}$

Each design is required to store the same amount of rotational kinetic energy.

Suggest why the designers need to consider these densities and breaking stresses when choosing a material for the flywheel.

Calculations are not required.

Calculations are not required.	[3 marks]

9

0 4

A proton with  $0.675~{\rm MeV}$  of kinetic energy collides and fuses with a stationary nucleus of boron-11  $\binom{11}{5}{\rm B}$ . An excited carbon-12  $\binom{12}{6}{\rm C}^*$  nucleus is produced.

$$p + \frac{11}{5}B \rightarrow \frac{12}{6}C^*$$

This excited carbon-12 nucleus de-excites to a stable carbon-12  $\binom{12}{6}$ C nucleus by emitting a gamma photon.

$$\frac{12}{6}C^* \rightarrow \frac{12}{6}C + \gamma$$

0 4 . 1

Calculate, in MeV, the energy of this gamma photon. Assume the carbon nucleus does not recoil when the gamma ray is emitted.

State your answer to an appropriate number of significant figures.

mass of 
$${11 \atop 5}B$$
 nucleus =  $11.00666$  u

mass of 
$${}^{12}_{6}\mathrm{C}$$
 nucleus =  $11.99680~u$ 

[5 marks]

energy of gamma photon = MeV

**0 4** . **2** An alternative mode of decay for  ${}^{12}_6\text{C}^*$  is decay into a beryllium-8  $\binom{8}{4}\text{Be}$  nucleus and an alpha particle  $\binom{4}{2}\alpha$ .

$$^{12}_6\text{C}^* \rightarrow ^{8}_4\text{Be} + ^{4}_2\alpha$$

The carbon nucleus is initially stationary. The beryllium-8 nucleus and the alpha particle move as a result of the decay.

Compare the momentum and the kinetic energy of the  ${}^8_4 ext{Be}$  nucleus to the momentum and the kinetic energy of the alpha particle immediately after the decay.

Support your answer with a calculation.

[4 marks]

momentum		
kinetic energy		
<u> </u>		

Question 4 continues on the next page

0 4.3	One alpha particle with $2.9\ MeV$ of kinetic energy rebounds from a different stationary $^{12}_{\ 6}\mathrm{C}$ nucleus.	Do not outside box
	Show that the closest separation between the alpha particle and the ${}^{12}_6\mathrm{C}$ nucleus is approximately $6~\mathrm{fm}$ .	
	[3 marks]	
0 4.4	Nuclear radii were initially estimated using the technique of the closest approach of	
	alpha particles.  Electron-diffraction experiments give more accurate determinations of nuclear radii.	
	Suggest why.	
	[2 marks]

0 5.1	The intensity of solar radiation at the radius of the Earth's orbit is $1400~W~m^{-2}$ .	
	Calculate the power output of the Sun.	
	distance of Earth from Sun = $1.5 \times 10^8 \ km$ [2 r	marks]
	power output =	W

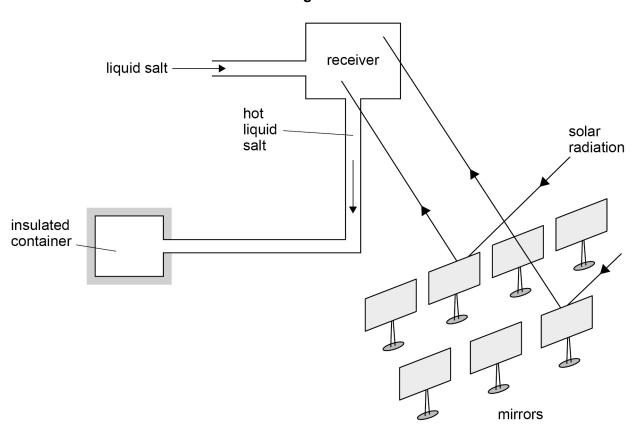

Question 5 continues on the next page

Concentrated solar power (CSP) stations store the energy from solar radiation.

Figure 5 shows one CSP station.

Figure 5

Mirrors reflect solar radiation onto a receiver. Energy from the solar radiation is transferred to liquid salt that flows through the receiver. The hot liquid salt is stored in an insulated container.

0 5 . 2

This CSP station has  $10\ 000$  mirrors. Each mirror has a reflecting area of  $120\ m^2$  and a reflection efficiency of 90%.

The intensity of solar radiation at each mirror is 900 W m<sup>-2</sup>.

Calculate, in MW, the total power of the solar radiation reflected by the mirrors.

[2 marks]

total power =	MW

0 5. The reflected solar radiation heats liquid salt flowing through the receiver.

Liquid salt enters the receiver at 290  $^{\circ}C$  and leaves at 570  $^{\circ}C.$  The salt flows through the receiver at a rate of 0.75  $m^3~s^{-1}.$ 

Calculate the rate of energy transfer to the liquid salt in the receiver.

specific heat capacity of liquid salt =  $1.5~kJ~kg^{-1}~K^{-1}$  density of liquid salt =  $1800~kg~m^{-3}$ 

[3 marks]

rate of energy transfer =

Question 5 continues on the next page

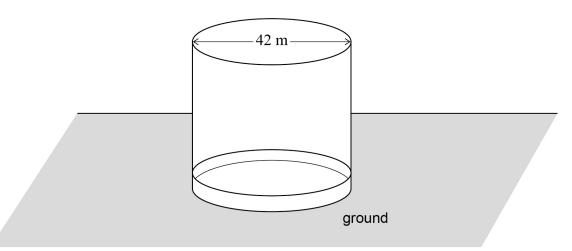

0 5 . 4

The hot liquid salt is stored in an insulated container.

**Figure 6** shows one cylindrical storage container for liquid salt at  $570\,^{\circ}$ C. The internal diameter of the container is  $42\,\mathrm{m}$ .

Figure 6

The initial rate of energy transfer through the floor of the container must be less than  $100~\rm kW$ . Assume that the temperature of the ground below the container remains constant at  $15~\rm ^{\circ}C$ .

Deduce whether a concrete floor of 45 cm thickness will be suitable.

thermal conductivity of concrete =  $0.24~W~m^{-1}~K^{-1}$ 

[3 marks]

10

Do not write outside the box

0 6.1 Define the binding energy of a nucleus.

[1 mark]

**0 6 . 2** Calculate the binding energy of a nucleus of thorium-232  $\binom{232}{90}$ Th.

mass of  $\frac{232}{90} Th \, \text{nucleus} = 3.852 \times 10^{-25} \, kg$ 

[4 marks]

binding energy = J

Question 6 continues on the next page

0 6 . 3

Thorium-232 nuclei absorb neutrons and become uranium-233 nuclei after a series of radioactive decays.

$$\frac{1}{0}$$
n +  $\frac{232}{90}$ Th  $\rightarrow \frac{233}{90}$ Th

$$\textbf{R} \rightarrow \begin{array}{c} 233 \\ 92 \end{array} \textbf{U} \, + \, \begin{array}{c} 0 \\ -1 \end{array} \boldsymbol{\beta}$$

Deduce the proton number and nucleon number of **R**.

[1 mark]

proton number =	
nucleon number =	

0 6 . 4

Uranium-233 nuclei undergo neutron-induced fission.

One possible fission reaction is shown below.

$${ {1 \atop 0} n \, + \, {233 \atop 92} \, U \, \rightarrow \, {136 \atop 54} Xe \, + \, {95 \atop 38} Sr \, + \, 3{1 \atop 0} n }$$

Table 2 shows the binding energy per nucleon for each nuclide.

Table 2

Nuclide	Binding energy per nucleon / MeV
<sup>233</sup> <sub>92</sub> U	7.60396
136 54 Xe	8.39619
95 38 Sr	8.54912

Calculate, in J, the energy released in this fission reaction.

[3 marks]

Question 6 continues on the next page

0 6.5	When a large number of nuclei of uranium-233 undergo fission, the average energy released per fission will be different to your answer to Question <b>06.4</b> .
	Explain why.  [1 mark]
0 6.6	The critical mass of uranium-233 is 16 kg.
	Show that the radius of a sphere of uranium-233 of critical mass is approximately 6 cm.
	density of uranium-233 = $1.9 \times 10^4 \ kg \ m^{-3}$ [2 marks]
	[2 marko]

		ks]
		ks]

END OF SECTION A

## **Section B**

Each of the questions in this section is followed by four responses, A, B, C and D.

For each question select the best response.

Only **one** answer per question is allowed.

For each question, completely fill in the circle alongside the appropriate answer.

CORRECT METHOD

If you want to change your answer you must cross out your original answer as shown.

If you wish to return to an answer previously crossed out, ring the answer you now wish to select as shown.

You may do your working in the blank space around each question but this will not be marked. Do **not** use additional pages for this working.

Which produces the largest change in temperature in a system?

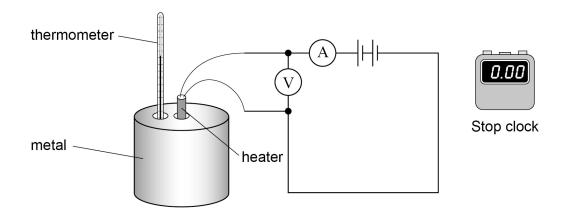

[1 mark]

	Work done on system	Heating of system	
A	+100 J	-200 Ј	0
В	-100 Ј	+300 J	0
С	-100 Ј	-300 Ј	0
D	+100 J	+150 J	0

Do not write outside the box

0 8 A student uses the equipment below to determine the specific heat capacity of a metal.

Which change to the experimental procedure increases the accuracy of the measured value of the specific heat capacity?

[1 mark]

- A insulating the metal block
- **B** repeating the measurements and calculating a mean
- C using a metal block with a greater mass
- **D** using a thermometer with a smaller resolution

Turn over for the next question

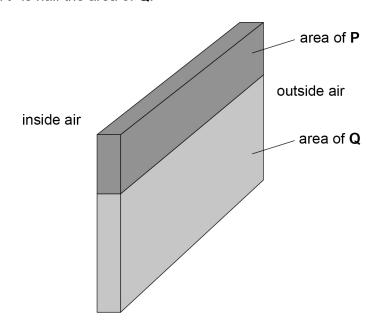

0 9

Part of a house wall contains two materials,  ${\bf P}$  and  ${\bf Q}$ . The wall separates air at different temperatures.

The U-value of **P** is four times the U-value of **Q**.

The area of **P** is half the area of **Q**.

What is  $\frac{\text{rate of energy transfer through } \mathbf{P}}{\text{rate of energy transfer through } \mathbf{Q}}$ ?
